

From the 12/9/22 release of VAERS data, there are 27,624 adverse event reports from the Covid shot in Indiana, up from 27,494 since the last report 7 days prior.

These reports include:

- 56 year old male got the Moderna shot and a flue shot on 11/4/21. On 11/20/21 his joints became very weak. His elbows, shoulders, hips, and ankles had no energy for days. It was like his arms just wanted to hang because his joints were so weak. He could barely push the pedals to drive his ankles were so weak. This lasted for about a week. As of the time of this report on 12/5/22, he still experiences this from time to time. ID [2522963](#)
- 31 year old male had the Moderna shot 12/2/21. On 8/1/22 a diagnostic ultrasound located a nodule on his left thyroid lobe. On 10/25/22 a biopsy showed he has thyroid cancer. He was told he had a genetic marker that predisposed him to developing thyroid cancer. At the time of this report on 12/5/22, he is scheduled for surgery the following week. A treatment plan will be determined after surgery. ID [2523212](#)
- 65 year old female had the Pfizer shot on 11/9/22. On 11/12/22 she was diagnosed with blood clots in her lungs. ID [2525441](#)
- 72 year old male had the Pfizer shot 6/14/21. By the next day he had an aversion to food, diarrhea, episodes of chills and feeling hot, feeling of “insides of his body crawling around”, sweating, vomiting, and muscle twitching in his back. He had extensive weight loss, was diagnosed with a massive fungal infection, vitamin deficiency, anemia. He saw the doctor five different times trying to get all this under control, but he is nowhere near normal and his quality of life has been greatly diminished. These side effects remained very severe for about a year. His symptoms have improved quite a bit with the addition of vitamins. ID [2526143](#)

From the 12/2/22 release of VAERS data, there are 27,494 adverse event reports from the Covid shot in Indiana, up from 27,475 since the last report 7 days prior.

These reports include:

- 7 year old male got the 2nd Pfizer shot on 12/1/21. Diabetic symptoms began the last week of December 2021. He was diagnosed with type 1 diabetes on 2/14/22. ID [2517298](#)
- 58 year old female got the Moderna shot on 11/8/22. She had a severe stroke on 11/13/22. ID [2517414](#)
- 37 year old female got the Pfizer shot on 10/19/22. On 11/16/22 she was diagnosed with shingles. ID [2517836](#)
- 63 year old female got the Pfizer shot on 5/27/22. Later that evening she experienced some itching, and by the next morning she had hives. Benadryl didn't help and by 5/29/22, they had spread to her eyes and mouth so she visited an urgent care clinic. She was given a strep test which came back negative. They suggested she continue taking Benadryl. She also developed a ring rash around the injection site. Her rash lasted two months. ID [2517861](#)
- 51 year old female got the Pfizer shot 11/18/22. The next day her forehead became tender to the touch and she had intermittent pain on the right side of her head. By 11/20/22, the pain spread and was not relieved by ibuprofen. On 11/21/22 she woke up with a rash on the right side of her forehead, scalp, and eye. She was diagnosed with shingles. ID [2518312](#)
- 51 year old male got the 2nd Pfizer shot 5/6/21. He **DIED** suddenly in his sleep on 7/11/22. He had had a recent doctor appointment and labs showing all current chronic medical conditions (psoriasis, diabetes, obesity, possible cirrhosis, chronic large T-cell LGL) were under control. ID [2521097](#)
- 68 year old male got the Pfizer shot on 7/19/22. On 9/1/22 he began to experience shortness of breath. A CAT scan showed he had fluid around his heart. ID [2521217](#)

From the 11/25/22 release of VAERS data, there are 27,475 adverse event reports from the Covid shot in Indiana, up from 27,412 since the last report 7 days prior.

These reports include:

- 64 year old female got the Moderna shot on 11/16/21. On 7/1/22, she began having high blood pressure and racing heart. These are now being controlled by medication. Prior to this she did not have these issues. At the time of this report on 11/18/22, she is still experiencing shortness of breath. ID [2511797](#)

- 67 year old male got the Pfizer shot 11/16/21. On 11/11/22, he had a CT scan which showed extensive liver metastases due to a GI primary, possible the colon. Best way to diagnose would be a CT-guided biopsy of liver. CT also showed portal vein thrombosis and some enlarged lymph nodes. Medical oncology consultation is recommended. ID [2511930](#)
- 68 year old female got the Moderna shot on 5/12/22. On 7/1/22 she began breaking out in hives. Benadryl did not help. Doctor prescribed hydroxyzine which helped at first, but they came back. She gets them all over her body and it often happens in the middle of the night. ID [2512785](#)
- 56 year old female got her 4th covid (Pfizer) shot on 10/23/22. First three shots were Moderna. On 11/8/22 she developed a strange, hard to describe sensation in her face. On 11/19/22, she saw a neurologist for progressing quadriparesis and abnormal brain and cervical spine imaging. Weakness is greatest in her lower extremities and she also has slurred speech and double vision. On 11/20/22, she followed up for suspected acute disseminated encephalomyelitis. ID [2513745](#)
- 33 year old female got the Pfizer shot on 10/7/22. Between 10/11/22 and the time of this report on 11/22/22 she has had three strokes. ID [2513947](#)
- 63 year old female got the Pfizer shot on 10/10/22. On 11/10/22 she was diagnosed with shingles. ID [2514015](#)
- 75 year old female got the Moderna shot on 10/28/22. Hours after the shot she began having uncontrollable diarrhea, migraines, night sweats, cough, cardiac tamponade, cardiac rupture, and cardiac clots. She **DIED** six days later. ID [2515715](#)
- 51 year old female got the Novavax shot and a flu shot on 11/15/22. The same day she lost her sense of taste. ID [2515822](#)

From the 11/18/22 release of VAERS data, there are 27,412 adverse event reports from the Covid shot in Indiana, up from 27,342 since the last report 14 days prior.

These reports include:

- 70 year old male got the Moderna shot and a flu shot on 10/6/22. On 11/1/22, he experienced shortness of breath and chest pain. A heart specialist in the hospital determined he had a 90% blockage in one of his arteries. A stent was inserted, and he was released two days later. ID [2499273](#)
- 48 year old female got Pfizer shot 7/15/21. On 7/18/21, she began to have discomfort in her left nipple which graduated into a palpable mass within a week. On 8/3/21 she had diagnostic testing done and was started on antibiotics. On 8/5/21, she got her second Pfizer shot. On 8/10/21, she was diagnosed with a staph infection. On 9/3/21, it was suspected that she had mastitis. On 11/10/21, she was started on another round of antibiotics. She had various testing and labs in November and December. On 1/25/22 she had a biopsy which showed florid acute and chronic inflammation with fibrosis and giant cell reaction and staph infection. On 3/2/22, she had a lumpectomy with a biopsy. Results showed breast tissue with fibrocystic changes, radial scar, fibrosis, usual ductal hyperplasia, ductal ectasia, apocrine metaplasia, microcalcifications, and small intraductal papilloma. On 5/26/22 she had an incisional rupture with significant drainage after a bike ride. A culture was taken and she started another round of antibiotics. The culture was positive for E. coli. On 5/29/22 she had a fever and her antibiotics were changed. On 5/31/22, she tested positive for covid. On 6/25/22, she had another incisional rupture without warning. On 7/21/22, she had a left nipple biopsy. Findings showed fibroadipose breast tissue with foreign body giant cell reaction, fat necrosis and scar tissue formation. On 8/25/22, green discharge was present and a culture was taken. She was started on another round of antibiotics. Culture showed Pseudomonas Aeruginosa numerous. On 8/27/22, she was admitted to the ER for IV Zosyn, labs, and other testing. She was discharged 9/2/22 with a picc line and started on a 10 day course of IV Zosyn. On 10/22/22, she was on the verge of rupture again. On 10/16/22, E. coli was found again. On 10/20/22, doctor recommended wide surgical excision including the nipple and as deep as healthy tissue. ID [2500063](#)
- 54 year old male had the Pfizer shot 12/17/21 after having had the Johnson & Johnson for his first shot. On 2/1/22 he was having shortness of breath, his pulse oxygen dropped below 75, and he was hospitalized for seven days. He was given prednisone for three months to raise pulse oxygen. CT scan showed 100% ground glass opacity. 60% lung capacity remaining. He can no longer ride a bike, climb stairs, or do any exercise. ID [2500166](#)

- 51 year old male had Moderna shot and flu shot on 10/13/22. He had a headache for two days beginning 10/14/22. He was hospitalized with stroke-like symptoms on 10/16/22 and diagnosed with Bell's Palsy. ID [2500172](#)
- 55 year old female got the Pfizer shot on 11/1/22. The next morning she had a flutter/twitch in her face then tingling and numbness on the side of face. She went to the doctor on 11/3/22 and was diagnosed with Bell's Palsy. ID [2500269](#)
- 56 year old male got the Moderna shot on 11/22/21. On 11/28/21 he began experiencing intermittent double vision, dizziness, and haziness. Over the next couple weeks, double vision became permanent. Lenses were administered to help correct the vision and a CT was ordered. CT showed no abnormalities. Referral was then made to a neurologist who ordered an MRI. Once again, nothing abnormal. Myasthenia Gravis (MG) was then expected as the cause, so antibody tests were conducted which showed no signs of antibodies for MG. He was then referred to another doctor who performed an optical evaluation. He did not think the cause was MG, so blood tests were ordered which came back showing no antibodies associated with MG. He then saw a retina specialist and underwent a single fiber EMG test for MG. That test also shows no signs of MG. As of 11/8/2022, there is no diagnosis of why sudden onset of double vision occurred. ID [2501754](#)
- 72 year old female got the Pfizer shot on 2/8/21. In April 2021, a mammogram showed abnormality. On 4/19/21 she had a biopsy. Pathology was significant for papillary features and it could not be excluded if there is any invasive malignancy and also DCIS (ductal carcinoma in milk ducts.) She had a needle lumpectomy on 6/1/21 which showed papillary ductal carcinoma in-situ DCIS. ID [2501764](#)
- 65 year old female got the Moderna shot on 10/8/22. She went to the ER 10/11/22 and was diagnosed with thrombocytopenia. ID [2501882](#)
- 55 year old male had the Pfizer shot 10/4/22. On 10/21/22, he began experiencing fatigue, memory issues, and difficulty finding words. ID [2503332](#)
- 26 year old female had the Pfizer shot on 12/3/21. At work on 12/13/21, she began feeling nervous, lightheaded, weak, sweating and her chest was pounding. She sat down but symptoms did not subside. She stood up and stumbled to the door to get help, blacked out, and fell into a wall. She was unconscious for ~20 minutes, very pale/grey, very sweaty, had irregular breathing, and was very tachycardic. A respiratory therapist put a pulse oximeter on her and her oxygen saturation was in the low to mid-80s. She was taken to ED by hospital's code team, IVs were placed, fluids given, CT scan, EKG, labs drawn. While recovering, she had uncontrollable shaking. ID [2504107](#)
- 48 year old female got the Pfizer shot on 11/12/21. The next day she had achiness, fever, and chills. On 1/15/22, she began having joint pain that has gotten progressively worse. She began getting bumps in areas of her body where she had tattoos that are four to six years old. She has severe swelling in her finger joints and knuckles. ID [2507098](#)
- 34 year old female got the Pfizer shot 8/1/21. Went to the ER in February 2022 and November 2022 for unexplained racing heart and high blood pressure. ID [2507116](#)
- 76 year old female got the Pfizer shot 10/27/22. On 11/12/22, she was admitted to hospital with NSTEMI (heart attack) with acute kidney injury, hypokalemia, generalized weakness, and acute cystitis. On the morning of 11/14/22, she was evaluated for potential stroke. She went into cardiac arrest and **DIED**. ID [2507280](#)
- 63 year old female got the Pfizer shot on 10/31/22. On 11/4/22, she had ulcerative lesions scattered on her body and in her mouth, sore throat, dizziness and headaches. ID [2508451](#)
- 15 year old female got the Pfizer shot 10/1/21. As of the time of this report on 11/16/22, the patient has a large mass, four to five inches in diameter, at the site of the second shot. This required an office visit and an ED visit. Mass is suspected to be scar tissue. ID [2509242](#)

From the 11/4/22 release of VAERS data, there are 27,342 adverse event reports from the Covid shot in Indiana, up from 27,297 since the last report 7 days prior.

These reports include:

- 45 year old male got the first Pfizer shot on 1/1/21. He has since had 3 boosters. On 5/1/21 he began having symptoms and was misdiagnosed many times, but finally has a diagnosis of lichen planus and will begin treatment next week. ID [2493462](#)

- 69 year old male got the Moderna shot on 3/25/21. Beginning 4/1/21 he experienced fluid retention and weight gain. His TSH levels have been historically normal. At his yearly exam on 10/6/21 his TSH level was 12.30. He was diagnosed with hypothyroidism and started treatment. ID [2493623](#)
- 50 year old female got the Pfizer shot on 9/28/22. She developed Bell's palsy nine days later. ID [2495005](#)
- 59 year old female got the Pfizer shot (dose 5) on 10/6/22. By 10/23/22 she developed deep vein thrombosis in her left leg and blood clots in both lungs. She was diagnosed in the ER on 10/24/22. ID [2495876](#)
- 36 year old female got the Pfizer shot on 4/12/21. That same day she had a low-grade fever and chills. She had periods of fever and chills through the beginning of 2022. In July of 2021 she began having heart palpitations. She has seen many doctors and specialists about this. She began taking a beta blocker which helped with the palpitations. In February of 2022 she had heart stents placed. Prior to the stents she was unable to sit upright because it caused difficulty breathing. She can now function normally for about an hour before she must sit down at a drastic angle to be able to breathe. Symptoms seemed to worsen after last booster. At the time of this report, she continues to have low-grade fever. ID [2496457](#)
- 70 year old male got the Pfizer shot on 5/23/51. On 11/3/22 he was diagnosed with metastatic colon cancer. ID [2497772](#)
- Unreported age female got the Pfizer shot in 2021. She has had depression in the past, but since the shot her depression has greatly increased. She is also experiencing breast pain, menstrual disorders, and fatigue. She had a D & C for her menstrual disorder. ID [2498791](#)

From the 10/28/22 release of VAERS data, there are 27,297 adverse event reports from the Covid shot in Indiana, up from 27,203 since the last report 7 days prior.

These reports include:

- 41 year old female got the Pfizer shot and a flu vaccine on 10/14/22. The evening after receiving these, she began to feel out of it, catatonic, unaware of her surrounding for 36 hours and unable to remember what happened during that time. Feels as if she has had a stroke and is having trouble speaking. At the time of this report on 10/23/22, she is hospitalized. ID [2486522](#)
- 64 year old female got the Moderna shot on 10/20/22. The same day she got a hot, itchy rash and when into afib and had difficulty breathing. As of the time of this report on 10/26/22, she still has the rash. The afib and difficulty breathing resolved the day she had the shot. ID [2489905](#)
- 59 year old male got the Moderna shot on 10/9/22. His right leg began to swell the next day and he was diagnosed with a blood clot on 10/12/22. He was prescribed Eloquis, diet modification, and rest. He began to be unable to put any weight on his right leg and his knee swelled. He went to the ER where they did tests and xrays, drained the fluid from his knee, and diagnosed him with gout. He was prescribed Allopurinol and Colchicine and released. ID [490033](#)
- 35 year old female got the Pfizer shot on 9/8/22. The same day she developed severe left arm pain and decreased range of motion. She has done months of physical therapy. ID [2490725](#)
- 35 year old female got the Pfizer shot on 10/1/22. She experienced throat itching and swelling, back spasms, and loss of bladder control. ID [2490726](#)
- 12 year old male got the Pfizer shot and a flu vaccine on 10/10/22. Nine days later he developed a rash all over his body and was diagnosed with erythema multiforme. At the time of this report on 10/27/22, he has not recovered. ID [2490819](#)
- Six patients reported their shot, some with multiple boosters, to be ineffective because they contracted Covid. IDs [2484988](#) (62 year old female), [2487067](#) (77 year old female), [2487448](#) (62 year old female), [2488433](#) (87 year old male), [2489550](#) (47 year old female), [2489554](#) (59 year old female.)

From the 10/21/22 release of VAERS data, there are 27,203 adverse event reports from the Covid shot in Indiana, up from 27,042 since the last report 7 days prior.

These reports include:

- 44 year old male got the Johnson & Johnson shot on 1/9/22. For the next month he experienced severe headaches worse than migraines, overall body aches and pains, abdominal pain, severe exhaustion, being unable to walk due to fatigue. He had a stroke about a month after getting the shot. He was taken to the ER, put on life support and taken off life support 4 days later. He **DIED** 2/27/22. ID [2478561](#)
- 35 year old female had the Moderna shot on 9/9/22. She had a fever 12 hours later and interrupted menses (had been in progress, stopped from 12-36 hours post-shot, and resumed.) Two weeks later she lost her sense of taste and smell. ID [2478604](#)
- 22 year old male got his second Moderna shot on 5/27/21. He developed severe left shoulder pain three days after the shot which continued into 2022. He began having headaches three hours after the shot which continued intermittently throughout September of 2021. In October they became severe. In December of 2021 he sought medical treatment and was diagnosed with migraines. His headaches also continued into 2022. On 5/30/22 he felt poorly and could barely move his shoulder. On 5/31/22 he experienced an altered mental status, was taken to the ER, and admitted to both cardiology and neurology. EEG showed abnormal background slowing. Brain MRI showed chronic anterior cerebrovascular ischemia (restricted blood flow to brain), likely serving as an epileptic focus. He had bradycardia (slow heart rate) with pulse 18-30. Working diagnosis "sick sinus syndrome" (a type of heart rhythm disorder that affects the heart's natural pacemaker), causing watershed ischemic cerebral event. A pacemaker was placed, which patient still has as of this report on 10/14/22. He has had three seizures since, with the last event causing a dislocated shoulder during a fall. Brain MRI June 2022 showed chronic ischemic change of basal ganglia and extending to right parietal lobe (chronic restricted blood flow to portions of the brain). He will be medically separated for this event. ID [2478614](#)
- 68 year old male got Moderna shot and flu shot on 10/11/22. The next day he experienced roaring in his right ear and some intermittent hearing loss. He will see and ENT for further evaluation. ID [2478888](#)
- 50 year old male got Moderna shot on 5/13/21. On 8/15/21 he had an outbreak of hives that was treated with antihistamines. On 8/28/21 he went to urgent care because of bad hives. On 9/23/21 he had a dermatologist visit and was prescribed antihistamines. On 12/11/21 he went to the ER because his hives were so bad and antihistamines were no longer effective. On 12/16/21 he was started on prednisone and had some testing done. On 1/14/21 an endocrinologist diagnosed him with Hashimoto's disease, and he started levothyroxine. On 03/23/21 he started Xolair for hives, but it proved ineffective, so he stopped. On 06/33/21 he started Cyclosporine but could not tolerate it because it increased his blood pressure. ID [2479613](#)
- 64 year old male got the Pfizer shot on 4/15/22. From 10/8/22-10/12/22 he was urinating black blood clots. He has scheduled a CT scan and a scope with a urologist. ID [2480481](#)
- 63 year old female got the Pfizer shot and the flu shot on 10/13/22. On 10/14/22 she fell around 12:30 pm and was taken by ambulance to the emergency department in cardiac arrest. She was given CPR and emergency medications. She **DIED** at 1:23pm in the emergency department.
- 25 year old female got the Pfizer shot on 10/11/22. She woke up with hives on 10/15/22 and they worsened through 10/16/22. A fever began the morning of 10/16/22 with acute genital ulcers beginning that afternoon. Symptoms worsened through 10/17/22 and have been consistent since as of the time of this report 10/19/22. ID [2482214](#)
- 39 year old male got the Moderna booster on 9/27/22. Two weeks later he woke up with hives covering his body. He was told by a doctor that he was having an allergic reaction and to alternate Allegra and Benadryl. As of the time of this report on 10/19/22, he gets hives if he does not take the medications. ID [2483514](#)
- 72 year old female got the Pfizer shot and the flu shot on 9/29/22. Within 15 minutes she began hallucinating, seeing a vision of a disembodied male face, smiling. As of the time of this report on 10/20/22, she has daily hallucinations. She went to the ER and had a head CT, lab tests, and everything came back normal. She has made an appointment for neuroscience. She has no problems with memory, cognition, walking, or interacting. She has no history of mental illness. ID [2483860](#)
- Four people who have the shot were hospitalized with covid. 80 year old male ID [2482860](#), 71 year old male ID [2484084](#), 38 year old female ID [2484093](#), 65 year old male ID [2484225](#)

From the 10/14/22 release of VAERS data, there are 27,042 adverse event reports from the Covid shot in Indiana, up from 27,021 since the last report 7 days prior. Adverse events for the original covid shots and the bivalent shots are now reported under the same category.

These reports include:

- 60 year old female got the Pfizer shot on 5/25/22. One week later she had swelling in her legs and feet, shortness of breath, fatigue, irritating cough, pitting edema in lower legs and congestive heart failure. ID [2469879](#)
- 51 year old female got the Pfizer booster on 1/8/21. With her first shot, she only had a sore arm. After her second shot and her first booster, she had chills, headache, nausea, dry vomiting. Her brain felt like it was on fire and she experienced a repeating cycle of passing out, throat closing, jerking alert while choking, dry heaving. This happened over and over again for 12-13 hours both times. ID [2472730](#)
- 38 year old female got the Johnson & Johnson shot on 12/1/21. Beginning in July of 2022 until present she has had cold and/or flu-like symptoms every month during ovulation. ID [2472939](#)
- 39 year old female got the Pfizer shot 2/4/21. She tested covid positive on 7/5/22. She **DIED** on 9/30/22. ID [2473530](#)
- Three children three and under were administered the 5-11 year old dosage of the Pfizer vaccine on 10/10/22. IDs [2476247](#), [2476250](#), and [2476257](#)

From the 10/14/22 release of VAERS data, there are 863 adverse event reports from the Covid shot in Indiana in children age 17 and under.

These reports include:

- 17 year old female got the Johnson & Johnson shot on 3/23/21. The same day she got blisters on her tongue and experienced anaphylactic shock for one hour. Benadryl and two EpiPens were used and then she was taken to the hospital where she received steroids and IV Benadryl. ID [1142350](#)
- 16 year old female got the Pfizer shot on 4/5/21. The next day she felt faint, vomited, complained that she felt
- 17 year old female got the Pfizer shot on 4/22/21. Five minutes later she became unresponsive and faded in and out of consciousness. Her pupils dilated and she was unresponsive to stimuli. Respiratory status was unclear. She became less responsive, so an EpiPen was administered. After this, she became more alert and breathing was normal. ID [1243033](#)
- 16 year old female got the Pfizer shot on 4/26/21. Shortly afterwards as she was scheduling her appointment for her second shot, she passed out unexpectedly, fell straight back, and hit her head on the floor. She was unconscious for about one minute. She came to and had no recollection of falling, had blurred vision, and was bleeding from the back of her head. She has never before fainted or had any reaction to a vaccine. ID [1259719](#)
- 16 year old female got the Pfizer shot on 4/22/22. Beginning 4/28/22 she had purple splotches on the soles of her feet, behind her ears, and on her armpits. They were extremely painful and ibuprofen offered only minimal relief. ID [1278581](#)
- 17 year old male got the Pfizer shot on 5/5/21. His throat became scratchy, and he was having trouble swallowing. An EpiPen was administered and he was taken by ambulance to the ER. ID [1290338](#)
- 17 year old female got the Pfizer shot on 4/6/21. On 4/23/21 she noticed blood in her urine. Urine culture was negative and she was given Amoxil. 5/3/21 she still had blood in her urine. ASO (strep) titer positive, monospot test was positive, and EBV panel was positive. ID [1292986](#)
- 14 year old female got the Pfizer shot on 5/13/21. About 15 minutes afterward she had dizziness, weakness in legs, and loss of vision. She was transferred to the emergency department. ID [1314432](#)
- 17 year old female got the Moderna shot on 5/16/21. The same day she had nausea, vomiting, lethargy, and headache. After six days she began to have chest pain, rapid heartbeat, and her nausea continued. She ended up being admitted to the hospital because of tachycardia. ID [1343689](#)
- 15 year old male got the Pfizer shot on 5/22/21. He began to have chest pain 12-24 hours later that worsened within 48 hours. He also experienced fatigue. Initial work up consistent with peri/myocarditis. Chest pain ceased with rest, but he continued to have throbbing heart pressure upon walking. ID [1346428](#)
- 16 year old female got the Pfizer shot on 5/7/21. About 18 hours later she began passing out. This occurred 9 times over 24 hours. A CT, MRI, 2 hour EEG, and 24 hour EEG all came back normal. ID [1360747](#)
- 12 year old male got the Pfizer shot on 5/19/21. On 5/21/21 he was diagnosed with osteomyelitis and treated with antibiotics. ID [1360961](#)

- 17 year old female got her first Pfizer shot on 4/6/21 and her second on 5/4/21. She experienced facial numbing after first shot and a seizure 20 days after her second shot. ID [1361144](#)
- 16 year old male got the Pfizer shot on 5/21/21. Fourteen hours afterward he experienced shortness of breath, warmth in chest, rapid heartbeat and chest pain. They went to the ER and he was diagnosed with pericarditis. ID [1364955](#)
- 16 year old female got the Pfizer shot on 6/3/21. Thirty to sixty seconds later she appeared to lose consciousness. She said it felt like a dream. She had twitches/spasms involving circular motions with her arms and leg. Leg extended then contracted, and her head rolled back. Upon coming awake she felt nauseous and sensitive to light. The episode lasted less than a minute, but it was 10-15 minutes before she felt well enough to get in a wheelchair to go to the car to go home. ID [1371826](#)
- 13 year old male got the Pfizer shot on 5/14/21. On 5/16/21 he began experiencing stomach pain in the middle of the night. During the day he would be fine, but for the next couple of nights he had extreme stomach pain. He was taken to the ER on 5/18/21. They found nothing abnormal and sent him home. The stomach pain continued intermittently. On 5/20/21 a petechial rash appeared on his legs. On 5/22/21 he began vomiting and went back to the ER. Again, they found nothing abnormal and sent him home. Intermittent stomach pain continued. On 5/24/21 he went to the pediatrician, and they suspected Henoch-Schonlein purpura, an autoimmune response. He ended up back in the ER where they did a CAT scan and discovered inflammation in his stomach and intestines. He was admitted to the hospital. The worst of his stomach pain occurred on 5/25/21. He was released on 5/26/21 with a diagnosis of HSP. At the time of this report on 6/11/21, he still had some pain, but not severe. ID [1390969](#)
- 14 year old female got the Pfizer shot on 6/6/21. On 6/11/21 she was diagnosed with appendicitis. ID [1394698](#)
- 16 year old male got the Pfizer shot on 6/6/21. That night, he developed headache, nausea, and chest pain. On 6/12/21 the chest pain became severe, and he went to the hospital. On 6/13/21 he was diagnosed with myocarditis. ID [1394849](#)
- 14 year old female got the Pfizer shot on 6/5/21. She has been on birth control for a year and had regular periods that entire time. Eleven days after her shot, she started her period after having just finished it 2 weeks prior. ID [1401473](#)
- 14 year old male got the Pfizer shot on 6/14/21. Twenty-four hours later he developed chest pain that increased in severity over the following 8 hours. He was taken to the ER for further evaluation. ID [1406561](#)
- 15 year old male got the Pfizer shot on 6/11/22. On 6/12/21 he began experiencing soreness, fatigue, malaise, myalgias, nausea, and chest pain. Echo showed low ejection fraction of 50% (heart not functioning as well as it should,) cardiac MRI showed mild myopericarditis, mild subepicardial enhancement of the mid to apical inferior wall and the mid inferoseptal wall, small pericardial effusion and mild pericardial enhancement and mild diffuse left ventricular hypokinesis with left ventricular ejection fraction of 50%. ID [1410473](#)
- 12 year old female got the Pfizer shot on 6/18/21. Approximately seven hours later she had multiple seizures lasting longer than 30 minutes. She was transported to the hospital via ambulance. ID [1413494](#)
- 14 year old male got the Pfizer shot on 6/22/21. He developed shortness of breath and chest pains that same day. On 6/27/21 he was diagnosed with myocarditis and admitted to the hospital. ID [1430395](#)
- 15 year old female got the Pfizer shot on 6/25/21. A couple days later she developed shortness of breath and chest pain. She went to the ER and was diagnosed with pericarditis. ID [1443195](#)
- 17 year old male received the Pfizer shot on 7/8/21. He experienced vomiting, malaise, hives covering body, shortness of breath, and chest pains. He was admitted to the ICU on 7/10/21 and diagnosed with myocarditis. He was still admitted at time of report on 7/13/21. ID [1466592](#)
- 16 year old female had Pfizer shot on 5/22/21. On 6/10/21 she had painful menstrual cramps and passed out, hitting her head on the wall. She went to the ER and required stitches. Bloodwork, CT scan, EKG, and chest x-ray showed no abnormalities. The first day of her next cycle on 7/27/21, she had severe cramps and felt like she would pass out again. Prior to the shot she never had cramps this severe and had never passed out. ID [1505434](#)
- 16 year old male got the Pfizer shot on 4/7/21. Ten days later he noticed blurred, wavy vision in his right eye. He went to the doctor the next day and his vision was 20/60 and a spot was discovered on the back of his retina. They determined he had inflammation in the back of his eye and it was causing scar tissue to form. He was told he would need surgery. ID [1513907](#)

- 12 year old female received the Pfizer shot on 6/16/21. She was admitted on 7/11/21 with headache (initially started 6/27, intermittent but progressed), left-sided weakness, brief syncopal episode and altered mental status and hallucinations. She developed uncontrollable and involuntary facial and body movements. She had positive Anti-NMDA antibodies and was ultimately diagnosed with anti-NMDA autoimmune encephalitis. Multiple drug interventions were attempted with no improvement. At the time of this report on 8/4/21, she was intubated with evidence of autonomic instability. She does not recognize her family members. ID [1526191](#)
- 14 year old female received the Pfizer shot on 6/24/21. She would normally begin her cycle around the 7th of the month. As of this report on 8/9/21 she has not had a menstrual cycle. ID [1536178](#)
- 15 year old female received the Pfizer shot on 7/28/21. Five days later she began having weakness in her legs. She then passed out and began ticking all over her body. As of this report on 8/12/21, the ticks have not ceased. ID [1549786](#)
- 16 year old female received the Pfizer shot on 4/16/21. The next day she experienced intense pins needles in right hand and fingers lasting 30 minutes and then subsiding with only expected soreness at injection site. On 4/18 about 30 minutes after doing homework with her right hand, she experienced intense pins needles in right fingertips burning up to elbow lasting 2 hours and continuing. As of the time of this report on 9/7/21, this issue has not been resolved. ID [1677833](#)
- 13 year old female had the Pfizer shot on 8/3/21. On 8/29/21, she had full body movements that settled into her right arm. These continuous tic-like movements prevent her from using her right arm and hand. She can't write for school or participate in golf. She has seen a neurologist, orthopedic surgeon, and other doctors. ID [1694263](#)
- 17 year old female got the Pfizer shot on 7/14/21. Since then her periods have been 10 times as painful and as heavy as they have ever been. ID [1718948](#)
- 14 year old male got the Pfizer shot on 7/28/21. The next day he developed a shingles rash on his right arm. He was given multiple medications. Rash lasted approximately 3 weeks and his symptoms completely resolved. He had never had chickenpox but did have his routine chickenpox varicella vaccinations at age 1 and 5, therefore this shingles outbreak was not a wild type shingles outbreak, but rather an outbreak from the weakened varicella vaccine strain given to him by varicella vaccination 13 and 9 years prior. ID [1775684](#)
- 14 year old male got the Pfizer shot on 9/12/21. The same day he began experiencing cluster headaches that have increased in intensity leading up to the time of this report on 10/11/21. He is also experiencing muscle and joint stiffness in limbs and back pain that disrupts sleep. ID [1776350](#)
- 12 year old male received the Pfizer shot on 11/16/21. About 24 hours later he experienced debilitating headaches, extreme fatigue, dry cough, sore throat, chest pain, lightheadedness, sensation of head being on fire, mild confusion, nausea, diarrhea, lethargy, neck and back pain, mottling and swelling in legs, decreased appetite, sensitivity to light and noise, and impaired balance. Symptoms became progressively worse so that he began sleeping excessive amounts and tolerated little activity. At the time of this report on 11/30/21, he had remained home from school and abstained from sports since 11/18/21. On 11/30/21 he was started on a 2-week course of amoxicillin and referred to a neurologist. ID [1910236](#)
- 15 year old female was give the Pfizer shot on 9/10/21. On 11/17/21 she began experiencing periods of paralysis of all four limbs that would last for 5-10 minutes. This has been occurring nearly every day up to the time of this report on 12/22/21. She was told this could last days, weeks, or months. She is no longer able to 6
- 5 year old female got the Pfizer shot on 12/3/21. She had 15 seizures within a week of the shot. She does have a history of epilepsy. These seizures were considered life-threatening. ID [1978741](#)
- that began the day before after she played soccer. She was hospitalized for potential myocarditis. ID [1980966](#)
- 17 year old female got the Pfizer shot on 12/21/21. On 12/25/21 she began having involuntary movement of legs, arms and torso. As of this report on 2/11/21, she has involuntary movements, seizure like activity, drooling, loss of speech, paralysis, convulsions, repetitive babble, rapid blinking of eyes, screaming, crying, holding of breathe, biting of tongue, hitting things/people, throwing things, and blank stares. These episodes happen daily, multiple times a day in most cases. Afterwards, she can't talk or has slurred speech, and often cannot walk or support self on legs. ID [2105493](#)
- 12 year old female got the Pfizer shot on 8/16/21 and 9/4/21. On 10/11/21 she was diagnosed with multisystem inflammatory syndrome. She was hospitalized for six days. ID [2129102](#)

- 5 year old male got the Pfizer shot on 11/24/21. On 12/13/21 he was diagnosed with multisystem inflammatory syndrome. He was hospitalized for two days. ID [2129111](#)
- 5 year old female got the covid shot on 11/16/21. On 12/25/21 she was diagnosed with multisystem inflammatory syndrome. She was hospitalized for six days. ID [2129143](#)
- 8 year old female got the Pfizer shot on 11/20/21. On 12/27/21 she was diagnosed with multisystem inflammatory syndrome. She was hospitalized for three days. ID [2129162](#)
- 13 year old male received the Pfizer shot on 1/29/22. He collapsed in gym class while running on 2/9/22 and was taken to the ER. He went into flash pulmonary edema and then coded with low cardiac function seen on bedside ECHO. He was placed on ECMO (a form of life support) and started on epinephrine and milrinone drips. He remained on ECMO for 7 days when he was decannulated (removal of tracheotomy tube.) He went to a cardiac catheter procedure which showed left main coronary artery narrowing and cardiac MRI showed possible transmural infarct (tissue death due to inadequate blood supply.) He was transferred to another hospital and was still inpatient as of this report on 2/28/22 pending possible LVAD or heart transplant. ID [2148665](#)
- 11 year old male got the Pfizer shot on 12/1/21. On 2/9/22 he was diagnosed with multisystem inflammatory syndrome. He was hospitalized for 4 days. ID [2258563](#)
- 6 year old male got the Pfizer shot on 12/2/21. On 12/18/21 he was diagnosed with multisystem inflammatory syndrome. He was hospitalized for 2 days. ID [2258582](#)
- 14 year old male got the Pfizer shot on 12/7/21. A new skin lesion developed at the site of the injection within a 3-4 month window. A shave biopsy was done on 5/5/22. He was diagnosed with compound spitzoid melanocytic proliferation (a kind of skin cancer) with immunohistochemical expression of ALK1. ID [2294366](#)
- 17 year old female received Pfizer shot on 1/18/22. On day 2 she was sore, day 3 very sore, day 4-9 in pain, with pain getting more severe every day. Day 10 and on, she had no use of left arm, holding arm to her body to get relief from pain. Her arm also felt "loose." She saw a shoulder specialist. On day 17 doctor prescribed Methylprednisolone Dose Pack. Each day her shoulder became less painful. She began physical therapy after steroid pack relieved most of the pain. Shoulder is no longer painful, but the "loose" feeling is still there. She continues physical therapy to strengthen the shoulder area that was affected. As of this report on 9/18/22 she is still dealing with the "loose" feeling and uncomfortable. ID [2450665](#)

From the 10/7/22 release of VAERS data, there are 27,021 adverse event reports from the Covid shot in Indiana, up from 26,994 since the last report 7 days prior.

These reports include:

- 9 year old female got the Pfizer shot on 9/29/22. The dose was not diluted as prescribed for a child of this age and the entire contents of the vial were given to her. She received 10x the recommended dose. Initial symptoms were pain/swelling/warmth at injection site, headache, low grade fever, general body aches. Symptoms worsened to fever of 103F, continued headache, body aches. Patient went to the ER late 9/30/22 and had labs and imaging done. ID [2468337](#)
- 51 year old female got the Pfizer shot on 10/1/21. On 3/14/22 she was diagnosed with hypothyroidism. ID [2470137](#)

From the 10/7/22 release of VAERS data, there are 83 adverse event reports from the bivalent Covid shot in Indiana, up from 58 since the last report 7 days prior.

These reports include:

- 71 year old male got the Pfizer shot on 9/21/22. This was his 5th shot total, first bivalent. Patient tested positive for covid in January of 2022 though he had no symptoms. At that time he had had a total of 4 shots. Shortly after his second booster, he began to have severe headaches, pain around the eyes, rapid heartbeat, etc. He had much bloodwork and imaging done, but nothing out of the ordinary could be found. Finally a neurologist diagnosed it as long covid and prescribed Nortriptyline. The drug quickly began to help and several months later symptoms were nearly gone to the point he was going to go off the medication. However, within a couple of days of getting the Bivalent booster, all the symptoms returned and are still prevalent, thus he did not stop the medication. ID [2467086](#)

- 79 year old female got the Moderna shot on 9/16/22. She had a rash on right “tight” (assume possibly thigh?) 9/21/22. It went away and came back again. The rash does not itch but is tender to the touch. Pharmacy was notified on 10/6/22 that she has terrible joint pain that increases with each passing day and is worse with cold. ID [2470897](#)

From the 9/30/22 release of VAERS data, there are 26,994 adverse event reports from the Covid shot in Indiana, up from 26,968 since the last report 7 days prior.

These reports include:

- 77 year old female got Moderna shot on 2/4/21. The same day she began experiencing chest discomfort. A month later she had a cardiac ultrasound and was discovered to have pericardial effusion (fluid around the heart.) ID [2459044](#)
- 31 year old female got the Johnson & Johnson shot on 9/22/22. The same day she got a severe migraine and was vomiting for ten hours. ID [2460503](#)
- 69 year old female got the Pfizer booster 10/25/21. On 11/1/21, she had cardiac symptoms including “squeezing in the center of chest” and fluttering and skipping heartbeats. She also experienced unsteadiness, lightheadedness, fatigue, and chills. ID [2462030](#)
- 29 year old female received the Pfizer shot on 9/10/21, not realizing at the time she was pregnant. She had a positive pregnancy test on 9/18/21 and miscarried on 10/26/21 (VAERS entry actually says 2022 for both of these dates, but considering she reported being pregnant in 2021 and the entry was made on 9/28/22, I assume this was a mistake.) Since then, she has had recurrent miscarriages. 11/2/21 (entered 2022, but again assuming this was a mistake) she went to the ER for chest pain, near fainting, and pain in sternum when breathing. Bloodwork showed extremely elevated WBC count, so antibiotics were given. She was diagnosed with pericarditis/myocarditis. 9/2/22 she was sent by ambulance to the ER for near fainting and inability to obtain BP reading. She was diagnosed with long QT syndrome. At the time of this report, she was 23 weeks pregnant. ID [2463137](#)
- 55 year old female got Pfizer shot 8/15/22. The next day she experienced continuous tinnitus which has not abated as of 9/30/22.
- Two patients, one with two boosters, reported their shots were ineffective because they contracted Covid. IDs [2464767](#) (46 year old female), [2465263](#) (79 year old female).

From the 9/30/22 release of VAERS data, there are 58 adverse event reports from the bivalent Covid shot in Indiana, up from 39 since the last report 7 days prior.

These reports include:

- 77 year old male got the Moderna shot 9/21/22. The same day he developed hives on his arms and legs. ID [2459736](#)
- 64 year old female got the Pfizer shot on 9/20/22. Two days later her lips became swollen and remain so at the time of this report on 9/25/22. ID [2459948](#)

From the 9/23/22 release of VAERS data, there are 26,968 adverse event reports from the Covid shot in Indiana, up from 26,940 since the last report 7 days prior.

These reports include:

- 17 year old female got Pfizer shot on 1/18/22. Her arm was sore on day 2, very sore on day 3, and progressively more painful until on day 10 she had no use of her left arm. It also felt “loose.” On day 17 she was prescribed a steroid pack and each day her shoulder pain lessened. She also began physical therapy. Ten months later her pain is gone, but she is still dealing with the “loose” feeling and discomfort. ID [2450665](#)
- 31 year old male got Moderna booster shot on 12/22/21. Neck became numb. As of 9/22/22, numbness in neck has not resolved. ID [2454346](#)
- Eight patients reported their shot, some with multiple boosters, to be ineffective because they contracted Covid, some severe cases. IDs [2450026](#) (43 year old female), [2450038](#) (60 year old male), [2450099](#) (51 year old

female), [2450282](#) (male), [2450323](#) (48 year old female), [2451903](#) (26 year old female), [2453149](#) (76 year old female), [2453190](#) (female).

From the 9/23/22 release of VAERS data, there are 39 adverse event reports from the bivalent Covid shot in Indiana.

These reports include:

- 36 year old female got Moderna shot on 9/10/22. Beginning 9/14 she had excruciating back pain from ribs to shoulder, pain around front ribs, and a fever. She began taking Tylenol every 8 hours for 4 days with no improvement. Remains ongoing at time of reporting 9/17/22. ID [2448553](#)
- 62 year old male got the Moderna shot on 9/16/22. The next day, he had a large, soft, swollen lump in his armpit about the size of his fist along with an internal burning sensation. ID [2450655](#)
- 68 year old female got Covid and flu shot on 9/13/22. She was hospitalized on 9/14 with severe body aches and a rash covering her entire body. ID [2452270](#)
- 49 year old female got Pfizer shot on 9/13/22. She developed chest pain within 24 hours, went to the emergency department 4 days later and was diagnosed with myocarditis. ID [2454826](#)

From the 9/16/22 release of VAERS data, there are 26,940 adverse event reports from the Covid shot in Indiana, up from 26,902 since the last report 21 days prior.

Some of these new reports include:

- 58 year old female got Pfizer shot on 2/15/21 and shortly thereafter developed tinnitus. I has been over a year and has not improved. ID [2431306](#)
- 69 year old male got Moderna shot on 2/18/21 and began having symptoms on 4/6/21 including daily shortness of breath, gasping upon activity or talking, throat feels tight most of time, occasional chest pain, increasing weakness. ID [2446163](#)
- 64 year old female got the Moderna shot on 3/10/22 and experienced rectal dysfunction and allergies-things she had never before in her life experienced. ID [2442873](#)
- 84 year old female got the Moderna shot on 7/16/22 and ended up in the ER 7/17, 7/18, and 7/19 each time with progressively worsening symptoms of nausea, vomiting, wheezing, cough, shortness of breath. The first two times she was given a nebulizer treatment and IV fluids. The third time she was admitted, and an EKG showed A Fib with rapid ventricular response. She was started on a diltiazem infusion and converted back to NSR. Patient was discharged from the hospital on 7/21 on diltiazem and apixaban with plans for an outpatient event monitor. Event monitor was completed and showed occasional PAC and PVC with borderline sinus tachycardia. ID [2440695](#)
- 42 year old female got the Moderna shot on 12/4/21. Starting in January 2022: Tinnitus, Dizziness/Vertigo, severe pressure in head and sinus congestion (prescribed prednisone and meclizine) February 2022: high blood pressure at Dr office read 160/100 elevated cholesterol (prescribed lisinopril and Lipitor) May 2022: right facial numbing/tingling/temporary paralysis (prescribed prednisone 3 times and 10-day antiviral Valtrex for suspicion of internal shingles) Facial numbing has lasted from May 2022 thru present. Diarrhea and weight loss. Ongoing numbness in tongue since receiving 2nd covid-19 shot on 5/14/21. ID [2440033](#)
- 80 year old female got Pfizer booster on 1/11/22. Patient initially got J&J vaccine with no adverse effects. She developed hives about 6 weeks after mRNA booster. After three months working with her internist, she was referred to an allergist. She was told that the allergist has seen similar cases "almost every day" related to the mRNA covid boosters and recommended Xolair shots but could not say if or when they would be effective. Patient conferred with her internist and decided that the possible positive outcome did not overcome the potential for no relief or adverse response. Patient now on regimen of 2 Zyrtec twice a day plus refrigerated Sarna Sensitive, and is unable to wear clothes or sleep more than three hours at a time. ID [2439963](#)
- 53 year old male got the J&J shot on 9/15/21 and presented with tinnitus on 9/18/21. To this day, tinnitus is constant. ID [2430079](#)

From the 8/26/22 release of VAERS data, there are 26,902 adverse event reports from the Covid shot in Indiana.

158 of these are deaths.

- -28 year old male who got the Moderna shot 3/24/21 died from cardiac arrest on 3/26/21. Coroner reported enlarged heart and liver.
- -31 year old male who got the Moderna shot 4/5/21 died from massive pontine hemorrhage and then cardiac arrest on 4/23/21.
- -36 year old female who got the Moderna shot 3/30/21 died on 5/7/21. Causes of death listed on death certificate: 1) COVID-19 2) Sepsis 3) Sarcoidosis 4) End stage renal disease Other: Hypertension, Congestive heart failure
- -40 year old male who got the Moderna shot 3/25/21 died from cardiomyopathy on 4/2/21.
- -42 year old male who got the Pfizer shot 2/23/22 died from a heart attack 3/19/22.
- -50 year old male who got the Johnson & Johnson shot 3/18/21 died from multiple organ failure 3/19/21.
- -51 year old male who got the Pfizer booster on 12/3/21 died from a large pulmonary embolism on 1/8/22.
- -58 year old male who got the Moderna booster on 11/19/21 died from a massive heart attack on 11/25/21.
- -67 year old woman who got the Moderna shot on 6/22/22 died from a heart attack on 7/7/22.
- -80 year old woman who got the Pfizer booster on 7/18/22 died on 7/19/22.

310 of these are in children 13 and under.

- -5 year old female got the Pfizer shot 11/6/21 and had widespread hives 11/8/21
- -5 year old female got the Pfizer shot on 12/3/21. She is epileptic and had an outbreak of 15 seizures within one week of the shot.
- -5 year old male got the Pfizer shot on 11/24/21. Diagnosed with Multisystem Inflammatory Syndrome on 12/13/21.
- -8 year old female got the Pfizer shot on 11/20/21. Diagnosed with Multisystem Inflammatory Syndrome on 12/27/21.
- -9 year old female got the Pfizer shot on 12/6/21. She woke up the next day with a stomach ache and severe arm pain in the opposite arm of shot. By afternoon she had a 102 degree fever, stomachache, headache, and the lymph nodes under both armpits were swollen the size of golf balls.
- -11 year old male got the Pfizer shot on 12/1/21. Diagnosed with Multisystem Inflammatory Syndrome on 2/9/22.
- -12 year old male got the Pfizer shot on 5/19/21. He developed right tibial osteomyelitis 5/21/21.
- -12 year old female got the Pfizer shot on 6/18/21. She began to have seizures seven hours later that lasted longer than 30 minutes.
- -13 year old female got the Pfizer shot on 6/16/21. She was previously healthy. She was admitted to the hospital on 7/11/21 with headache (initially started 6/27, intermittent but progressed), left-sided weakness, brief syncopal episode and altered mental status and hallucinations. Developed orofacial dyskinesias and choreoathetoid movements. Diagnosed with anti-NMDA autoimmune encephalitis. The patient has received the following treatments for her autoimmune encephalitis: * IVIG 7/12-7/16 * Methylprednisolone 1000mg IV daily 7/12-7/17 * Prednisolone 51mg BID 7/18 - 7/22 PO * Methylprednisolone IV ? 50mg IV BID 7/23-7/25 ? 40mg BID 7/26 - 8/2 ? 30mg BID 8/2 * Rituximab 600mg 7/23 * PLEX 8/2 - 8/4 Despite the above interventions, there has been no improvement in the patient's neuropsychiatric status. She is currently (8/4) intubated with evidence of autonomic instability (suspected secondary to her autoimmune encephalitis), but even prior to recent intubation a few days ago, she did not recognize family members.
- -13 year old female got the Pfizer shot 8/3/21. Uncontrollable full body movements began on 8/29 that settled in her right arm. Tic-like continuous movement that keep her from using her right arm and hand. She cannot write for school or participate in golf. She has seen a neurologist, orthopedic surgeon, and other doctors with no relief.

237 of these were life threatening.

- -17 year old female got the Johnson and Johnson shot on 3/23/21 and went into anaphylactic shock for an hour.
